INFORMATICS AND ANALYTICS DESIGN STRATEGIES

Author **Naeem Hashmi**

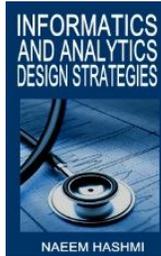

Chief Research Officer
Information Frameworks
<http://infoframeworks.com>
Email: nhashmi@infoframeworks.com

Entrepreneurial Healthcare Information Technology thought leader with innovative leadership style to vision, architect, plan and implement highly scalable Informatics, Data Mining, Clinical Intelligence and Business Intelligence solution; Healthcare Integration Hubs; secure portals for Physicians, Nurses, Care Givers and Patients.

Member of CIO-CHIME HIMSS AMIA
Member of MIT Sloan CIO Healthcare and analytics panels
Author/co-author of 4 Books
Frequent Speaker at National & International Conferences

Target Audiences

- ❑ IT professionals entering in the Healthcare business
- ❑ Informaticians and Healthcare Researchers
- ❑ IT Management team responsible for defining Informatics and Healthcare data management strategies
- ❑ Compliance, Legal and Senior management team to understand legal and Social impact of Informatics and predictive analytics

Chapters

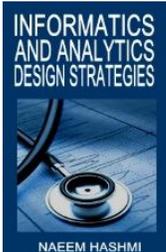

1. Introduction to Informatics and Analytics in Healthcare
2. Thinking about Thinking – Care Providers & Business
3. Methods and Techniques for Informatics & Analytics
4. Launching Informatics and Analytics initiatives
5. Analyzing requirements
6. Preparing content for Informatics and Analytics
7. Constructing Informatics and Analytics platform
8. Developing Informatics and Analytics
9. Informatics and Analytics Quality Assurance
10. Deploying Informatics and Analytics
11. Legal/Compliance aspects of Informatics
12. Social/Ethical aspects of Informatics

I start this book by describing the present state of the Healthcare Business ecosystem and how information flows in such ecosystem

Evolving healthcare ecosystem: What keeps executives awake at night today?

STATE OF THE HEALTHCARE BUSINESS

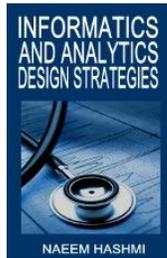

A higher level overview of Information flows within the Healthcare ecosystem

- Business
- Clinical care
- Patients

*Then I synthesize the
**Clinical Cognitive
Decision Making**
model to identify
information **artifacts**
needed to make
clinical decision(s).
I call such **artifacts** as
Informatics & Analytics*

***What do I mean by
Informatics and
Analytics?***

***Informatics and Analytics
are not the same.***

***However, they both play
significantly **different** roles in
the Healthcare **ecosystem**.***

Informatics and Analytics Framework (IA2F)

I outline a comprehensive framework that describes decision layers across the Healthcare ecosystem – ‘Taking care of the Patient Health’ at one end and ‘Taking care of the Business’ on the other.

PATIENTS ●—————● BUSINESS

In between, I place specific informatics and Analytics artifacts across the decision making spectrum within this Healthcare ecosystem.

Thinking about Thinking: Informatics and Analytics

The Clinical Decision Cognitive Model describes the psychology of a care provider in context of Patient situation. A Physician thinks differently than a Nurse

The Business Decision model focuses on the business – Keep the economics of the organization healthy .

Informatics and Analytics Platform

You need to understand that Informatics and Analytics bring unique data management challenges.

- *Knowledge Management*
- *Data Management*
- *Compliance and Privacy*

I outline an Enterprise Data Management strategy that addresses which platform is best suited for Informatics and Analytics. I also discuss Big Data platform usage in Healthcare for developing Informatics/Analytics

Methods and Tools

There are hundred's of methods and tools available to synthesize clinical content. Each method brings its own pluses and minuses. Which one to use?

Through use cases, I propose methodology and a checklist to select right set of methods/tools needed to meet your stated informatics and analytics objectives.

Designing Informatics and Analytics

Designing Informatics in much more than a technical task. The designers need to understand where such artifacts will be used and under what circumstances or the clinical work flow.

Clinical Cognitive Decision model must be on the backdrop of the design. Design must be simple, does not add more work or distraction for care providers.

Deploying Informatics and Analytics

The major challenge for Informatics is not the deployment BUT the Change Management and Adoptability .

Through use cases, I outline few approaches to prepare facilities for Informatics and Analytics deployments. For example, the Medical Office and Clinical Services must be involved to change and approve clinical processes and workflows needed to take advantage of the Informatics and Analytics.

Compliance, Legal, Social and Privacy Concerns

Health Content is still very personal and must be kept private. When designing informatics and analytics, you must not expose patient content.

Moreover data ownership must be established when data is aggregated and also who/how should communicate critical findings to patient – how, when, where?

Through use cases, I outline strategies to mitigate such concerns.
